Team Meeting Minutes: October 13, 2026

Oct 13, 2026

Meeting details

Field	Value
Date	October 13, 2026; transcript title indicates about 3:17 PM (not independently confirmed)
Length	About 88 minutes, including team discussion, class and side conversation
Attendees	Student voices include Tyler and Matthew; full attendance and speaker identities are not reliably labeled
Sponsor	No sponsor participation identifiable in the transcript
Purpose	Portfolio organization; reference-data discovery; course guidance on design review, remote participation, sustainability and peer assessment

Portfolio organization and shared files

Before class, the team reviewed the portfolio assignment and discussed checking the repository against its requirements. Meeting minutes, research summaries and sponsor answers were already being maintained. Team members said the schedule, budget and team contract were available; the discussion did not inspect every deliverable.

• Use the instructor-provided shared OneDrive/SharePoint portfolio. The team located its link in Discord under important links/pinned messages. This is distinct from Dr. Qualls's shared research folder.

• Organize evidence so reviewers can find it. Having files somewhere in GitHub or personal storage does not by itself establish portfolio completeness.

Woodruff reference files discovered

The team found FDL and watershed-boundary folders in Dr. Qualls's shared documents, identified C. Woodruff as the source and downloaded the collection. A remark that files were added six days earlier was not independently verified. Archive contents and the subsequent validation results are recorded on page 4.

Course guidance: Concept Design Review

The class described Concept Design Review as a formal team presentation to the client and lead instructor, demonstrating that the team has evaluated concepts and has a credible plan through the following spring. This guidance applies to software projects as well as physical designs. [28:17-34:30]

• Ground the audience in the objective, value proposition and requirements. Show the alternative concepts investigated and how they were compared against requirements, available time, budget and other constraints.

• Explain the preferred concept and why it was selected, using diagrams, flowcharts, prototypes or code demonstrations as appropriate.

• Present the remaining design/build/test plan, schedule and validation plan. Include budget detail where relevant; the lecturer allowed adjustment for projects without meaningful financial costs.

• Schedule when ready rather than rushing only to meet a nominal date. Coordinate with the lead instructor and client, ideally at least a week ahead.

• Book approximately one hour. Suggested structure: 20-40 minutes presenting plus discussion, often roughly 30 minutes presenting and 30 minutes of questions. About 15-30 slides was guidance, not a verified fixed requirement. Check the assignment document for the authoritative rubric. [36:34-40:20]

Review dates need confirmation

The transcript initially appears to name November 13, then later says the schedule shows "the twentieth" and that dates will be moved. The month/revised event date is not clear enough to establish a firm deadline. Existing project weeks November 2-9 remain planning anchors, not confirmed course deadlines. Confirm the Canvas schedule and team review date with the lead instructor before changing exact dates. [28:17-29:18; 56:38-56:45]

Learn from other teams

Students were told to attend at least two other teams' concept reviews and complete the review feedback form. Attending a review before the team's own review was recommended so useful presentation approaches could be adopted. These are individual course expectations; no attendance was recorded here. [40:51-43:03; 49:28-51:44]

Review scheduling and remote participation

• After agreeing a date, post the team/project, sponsor, time and location in the Canvas review-scheduling discussion. Include a Zoom link when remote participation applies. The department can assist with room reservations. [44:25-47:48; 52:15-55:19]

• Split Moscow/Coeur d'Alene teams may co-present the design review over Zoom; CDA members were told they do not need to travel to Moscow for that review. [56:45-57:43]

• Snapshot was discussed separately: CDA travel was not mandated, but the open presentation format makes ordinary Zoom participation difficult. Relying on Moscow teammates was discussed; a complete arrangement for this team was not settled. October 20 was recorded in the October 6 notes and should be confirmed against Canvas. [58:19-59:14]

Portfolio submission: October 15

The class explicitly discussed submitting the portfolio to the lead instructor by October 15. Provide the shared electronic link, or tell the instructor that the existing shared portfolio is ready to review. Do not assume the instructor will inspect it before being notified. Printed binders were not requested. The first review provides scored feedback; another submission follows at the end of the semester. [82:28-83:57; relevant class remarks around 84:16]

Sustainability and sustainment

The class asked teams to consider economic, environmental and social effects, resilience and how the result can remain useful after capstone. Only include claims or sustainability goals the team can explain. For this project, maintained data access, reproducible processing, storage/computing costs and long-term ownership are useful topics to investigate; these are applications of the guidance, not new sponsor commitments. [60:13-69:57]

Individual peer assessment

Each student completes an assessment of themselves and teammates and submits it privately to the lead instructor. Guidance covered 1-5 ratings, time/value contribution shares totaling 100%, and a meaningful strength and improvement area for each person. Feedback should be honest and constructive. The Fall deadline was recalled as before Thanksgiving, not confirmed; check Canvas. Assessments recur in spring and after Expo. Do not place completed private assessments in the shared repository. [70:32-81:38]

Follow-up: reference-data validation

This section records repository work completed October 13 after inspecting the supplied archive. These measurements were not statements made during the recorded meeting.

• Collected the original ZIP, report, detailed results, two generated PC1 GeoTIFFs and run log under db/validation/woodruff/. The seven copied inputs were SHA256-verified; originals remain unchanged. Data is gitignored. Code remains in api/, not db/.

• The supplied ZIP contains FDL and LDS mosaics for 2000-2016 and a boundary shapefile. No author PC1 raster or additional PCA script is included. The folder indicates NDSI 10; XML records mosaicking in 2021, not complete processing provenance.

Check	Measured result
Grid alignment	All 17 FDL grids share shape, CRS and transform; native raster not resampled
Boundary / D matrix	41,346 pixel centers inside the supplied boundary; all have complete 17-year records
PC1 explained variance	93.604835% covariance; 93.684388% correlation
Scaling comparison	Pearson correlation 0.999860; rank correlation 0.999903
Independent numerical check	Covariance weights and variance agree with SVD within about 4e-15 and 1.4e-15
Export check	Both generated GeoTIFFs passed reopened value, mask, CRS and transform checks

What the results establish

The checks support the repository PCA calculation on Woodruff's FDL inputs. They do not independently validate team-computed FDL dates or agreement with an author PC1. Both scaling options give similar patterns, so D06 remains unresolved. High explained variance is not a scientific accuracy score or an application acceptance target.

The supplied current FDL script already specifies threshold 10, DOY 91, two-way search and flag handling. The uncertainty is whether those settings and the current product collection produced the historical rasters. Metadata contains 366, but no 0/365/366 occurs inside the supplied boundary. The mask has 157 fewer pixels than the 2019 study; the reason is unconfirmed.

Corrections and transcription limits

• The early statement that "we have everything" is a team impression, not verified completion. Repository review found substantial evidence, but the seven portfolio headings and links/copies of externally held deliverables still need attention.

• Keep reported meeting discussion, instructor guidance, measured follow-up results and proposed project updates distinct. No new assignee acceptance, revised exact deadline or scientific acceptance threshold was established by the validation run.

• Speakers are unlabeled, audio overlaps and the remote class connection started late. Off-topic material, jokes and technical interruptions are omitted. The late mixed-audio segment is not a reliable continuous record of the lecturer. Unclear dates and attendance are explicitly qualified.

Action items

Owner	Task	Due / status
Team; coordinator not agreed	Organize seven portfolio sections; locate/link contract, PRD, value proposition, budget, schedule and DVP; notify lead instructor when ready	October 15 course submission discussed
Team	Confirm Snapshot date and how this split-campus team will participate	Before Snapshot; October 20 previously recorded
Team with instructor/client	Confirm review date; prepare concept comparison, plan and evidence; post confirmed logistics in Canvas	Date not settled; arrange in advance
Each student	Attend at least two other teams' reviews; complete private peer assessment	Review dates as scheduled; assessment deadline check Canvas
Team	Review proposed board updates: 2.3 prototype completion; 2.4 partial receipt; 2.7 existing tests; 2.8 validation progress and unresolved D06	Proposals only; GitHub unchanged
Team	Compare independently computed FDL against supplied historical data with documented assumptions; compare author PC1 if it becomes available	Open; no new date agreed
Repository follow-up	Centralize reference files and record PCA/SVD/export findings	Completed October 13
